

Spider Strap for Adult or Child Restraint Board - Holtex

Children's Spider Strap for Immobilization on a Hard Surface

The **Holtex pediatric spider strap** is an immobilization accessory designed to **secure children on a hard surface**. It is used during emergency response, lifting, or transport procedures to stabilize young patients while they are being treated.

This pediatric model provides **complete immobilization on a hard surface**, complementing the transport and restraint equipment used by emergency professionals, paramedics, first responders, local authorities, and facilities equipped with emergency response gear.

Support Tailored to Young Patients

Unlike an adult spider strap, this model is specifically designed for **immobilizing children**. It ensures support better suited to their body type when securing **them** on a hard surface.

The spider strap design facilitates the distribution of support points across the patient's body. It helps limit movement during handling and contributes to safer transport or evacuation.

When should a pediatric spider strap be used?

The **pediatric spider strap** is used when a young patient needs to be secured on a hard surface for immobilization, lifting, or transport. It can be integrated into emergency equipment that includes a hard surface and additional restraint accessories.

Why choose a pediatric model?

The pediatric model is better suited for securing a young patient. It allows for immobilization that is better suited to a child's body shape than an adult model, while maintaining the principle of multi-point restraint.

A medical device for professional use

The Holtex pediatric spider strap is a **Class I medical device**. It bears the **CE mark** and meets the needs of professionals seeking a support solution specifically designed for children on a rigid surface.

Non-sterile, it easily integrates into emergency, ambulance, community, or medical facility equipment that

includes immobilization and transport supplies.
