

Manikin obese adult choking for HEIMLICH maneuver

Adult obese dummy for choking simulation.

The obese choking dummy with carry bag is a training device designed to simulate an obstructed airway, enabling students to learn how to apply maneuvers to clear blocked airways. The mannequin operates on the principle of abdominal thrusts or back blows, first aid techniques commonly used in the event of choking. It provides a realistic, hands-on experience for students training in first aid, medicine or other emergency care disciplines.

Students can observe the effectiveness of their actions through visual confirmation of an object being expelled after the correct application of pressure. This mannequin allows students to familiarize themselves with anatomical landmarks, adjust the pressure exerted during the maneuver, and understand how blocked airway clearance works.

Specifications:

- **Dimensions:** approx. 76 cm x 53 cm x 33 cm
- Sleeve for mannequin
- Soft carrying bag for easy transport and storage
- **Simulation method:** The manikin simulates airway obstruction by a foreign body (food, object, etc.), requiring rapid intervention.
- **Materials:** Designed in durable, flexible and easy-to-clean plastic for prolonged use.

Benefits:

- **Realistic training:** The dummy faithfully reproduces a choking situation, enabling total immersion in the emergency maneuver.
- **Visual reward:** The expulsion of an object during a successful maneuver gives students immediate feedback on the quality of their intervention.
- **Anatomical landmarks:** Thanks to the presence of landmarks such as the xiphoid process and supra-sternal notch, students can learn to precisely locate pressure application zones for maximum efficiency.
- **Portable and easy to carry:** With its soft carrying bag, this mannequin is easy to move and store, making

it ideal for on-site training or mobile courses.

- **Durability:** Robust materials ensure a long service life and intensive use without rapid degradation.

Uses:

The Obese Choking Manikin is essential in first aid training, particularly for teaching emergency resuscitation techniques and maneuvers for clearing obstructed airways. Suitable for :

First-aid schools: Allows students to be trained in a realistic emergency situation, with a mannequin of a size that simulates a typical obstruction in an overweight person.

Medical and paramedical training: For medical, nursing and other paramedical students, this mannequin provides hands-on training in choking first aid.

Corporate and association workshops: Used in life-saving training sessions, it helps raise awareness of the importance of rapid intervention in the event of choking.

Emergency simulations: Useful for emergency services, firefighters and first-aiders to prepare for choking situations within a broader framework of practical training.

The obese choking dummy with carry bag is an indispensable training tool for anyone wishing to master airway clearance techniques and learn how to effectively manage choking emergencies. With its precise anatomical markings, simulated foreign body obstruction and immediate visual feedback, it is a high-quality teaching aid. Its portability and robustness make it a wise investment for all first aid and resuscitation training courses.
