

Drive head for cannula insertion

Head model with airway for cannula installation.

The Adult Airway Head Model is an **innovative, portable device** designed for teaching airway management in emergency situations. This device simulates upper airway management, including the introduction of oropharyngeal, nasopharyngeal and laryngeal masks. Thanks to its compact size and ease of use, it is the **ideal tool for practical training of first-aiders and students in resuscitation and first-aid training**.

Features:

- **Dimensions** : 23 x 17.80 x 15.25 cm
- **Portable and lightweight**: Easy to carry and use during training sessions.
- **Realistic simulations**: Faithfully reproduces the insertion of oropharyngeal, nasopharyngeal and laryngeal airway devices.
- **Durable material**: Made from high-quality materials for long-lasting use and resistance to wear and tear.
- **Practical design**: Enables hands-on learning of airway management with realistic accessories.

Benefits:

- **Hands-on learning**: Offering a more tangible learning experience than theoretical methods, this airway trainer allows students to familiarize themselves with real-life techniques.
- **Ease of use**: Its intuitive design enables instructors and students to get to grips with it quickly, making training sessions more effective.
- **Varied simulations**: This device offers the possibility of practicing on different types of airway, an essential skill for optimal emergency management.
- **Compact and transportable**: Its small size makes it ideal for mobile training, both in the classroom and in the field.
- **Robust**: Built to withstand the rigors of training environments, this simulator is built to last.

Applications:

The head model with airway is designed for healthcare professionals and resuscitation instructors. It is used for teaching airway management techniques in emergency situations. It is ideal for :

Basic life support training for adults.

Practical training in the insertion of oropharyngeal and nasopharyngeal airway management devices.

Learning how to use a laryngeal mask in emergency situations.

Simulations in stressful situations to develop first-aiders' reactivity and dexterity.

Instructors can use it to demonstrate the different stages of airway management and allow students to practice in a controlled environment.

The Adult Airway Trainer is **an essential tool** for all basic life support training. Its compact design, ease of use and robustness make it an ideal choice for trainers and students wishing to perfect their airway management skills. Thanks to this device, students can prepare effectively for emergency intervention, by practicing on realistic and varied simulations. Offering excellent value for money, this trainer is a wise investment for any first aid and resuscitation training establishment.
